"Neuropilin-2 and neuropilin-1 are receptors for the 165-amino acid
form of vascular endothelial growth factor (VEGF) and of placenta
growth factor-2, but only neuropilin-2 functions as a receptor for
the 145-amino acid form of VEGF.",

ALTERNATIVE PRODUCTS: 3 ISOFORMS; A22 (SHOWN HERE), A0 ARE PRODUCED BY ALTERNATIVE SPLICING.
SIMILARITY: BELONGS TO THE NEUROPILIN FAMILY.

SIMILARITY: CONTAINS 2 CUB DOMAINS.

SIMILARITY: CONTAINS 2 F5/8 TYPE C DOMAINS.

SIMILARITY: CONTAINS 1 MAM DOMAIN.

CHILDON STREET OF THE CARDIOVASCULAR SYSTEM, IN ANGIOGENESIS, IN THE FORMATION OF THE CARDIOVASCULAR SYSTEM, IN ANGIOGENESIS, IN THE FORMATION OF CERTAIN NEURONAL CIRCUITS AND IN ORGANGGENESIS OUTSIDE THE NERVOUS CERTAIN NEURONAL CIRCUITS AND IN ORGANGGENESIS OUTSIDE THE NERVOUS CIRCUIT MEDIATES THE CHEMOREPULSANT ACTIVITY OF SEMAPHORINS. IT DINGTON TO SEMAPHORIN 3A, THE PLGF-2 ISOFORM OF PGF, THE VEGF-15S ISOFORM OF VEGF-10DING TO KDR AS INCREASED CHEMOTAXIS.

CIRCUIT MAY REGULATE VEGF-INDUCED ANGIOGENESIS (BY SIMILARITY).

CIPCUIT SUBCELLULAR LOCATION: Type I membrane protein.

CIPCUIT SUBCELLULAR FOOUND IN THE EMBRYONIC NERVOUS SYSTEM.

CIPCUIT SIMILARITY: CONTAINS 2 CUB DOMAINS.

CIPCUIT SIMILARITY: CONTAINS 2 F5/8 TYPE C DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Q9QWJ9;

Ra Submitted (JUI-1997) to the EMBL/GenBan/GenBasses.

Control (JUI-1997) to the EMBL/GenBan/Genesis, lymphangiogenesis of the in angiogenesis, lymphangiogenesis of the interest of the vertical control and also has effects on the permeability of blood migration and also has effects on the permeability of blood vessels. May function in the formation of the venous and lymphatic vascular systems during embryogenesis, and also in the maintenance of differentiated lymphatic endothelium in adults. Binds and control of the vertical control of the venous and lymphatic endothelium in adults. Binds and control of the vertical control

2. J. Neurobiol. 29:1-17(1996).

2. C. FUNCTION: RECEPTOR INVOLVED IN THE DEVELOPMENT OF THE CARDIOVASCULAR SYSTEM, IN ANGIOGENESIS, IN THE FORMATION OF CERTAIN NEURONAL CIRCUITS AND IN ORGANOGENESIS OUTSIDE THE NERVOUS CERTAIN NEURONAL CIRCUITS AND IN ORGANOGENESIS OUTSIDE THE NERVOUS CIRCUITS OF SEMAPHORINS. IT BINDS TO SEMAPHORIN 3A, THE PLGF-2 ISOFORM OF PGF, THE VEGF-165 ISOFORM OF VEGF AND VEGF-B. COEXPRESSION WITH KDR RESULTS IN INCREASED VEGF-165 BINDING TO KDR AS INCREASED CHEMOTAXIS.

2. C. IT MAY REGULATE VEGF-INDICED ANGIOGENESIS (BY SIMILARITY).

3. C. IT MAY REGULATE LOCATION: Type I membrane protein.

3. C. IT SIMILARITY: BELONGS TO THE NEUROPILIN FAMILY.

3. C. IT SIMILARITY: CONTAINS 2 CUB DOMAINS.

3. C. IT SIMILARITY: CONTAINS 1 MAM DOMAIN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61
                                                                                                                                                                                    closing blastopore with greater expression ventral animal pole, expressed in the ectoderm flanking neural plate. At the 10-somite stage, expressed tailbud and cranial neural crest. At the 20-somi expressed in the hematopoietic system. SIMILARITY: BELONGS TO PEPTIDASE FAMILY M12A. SIMILARITY: CONTAINS 2 EGF-LIKE DOMAINS. SIMILARITY: CONTAINS 5 CUB DOMAINS.
                                                                                                                                                                                                                                                                                    FUNCTION: Required for patterning ventral tissues of increase bone morphogenetic protein (BMP) activity gastrulation by proteolytic cleavage of chordin and from inactive complexes.

TISSUE SPECIFICITY: During gastrulation, accumulate the protein active complexes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        LLGKHCGN-IAPPTIISSGSVLYIKFTSD-YARQGAGFSLRYEI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      receptor)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NRP1_HUMAN
ISOFORM IS SECRETED.

ISOFORM; MEMBRANE-BOUND (SHOWN HERE)
ALTERNATIVE PRODUCTS: 2 ISOFORMS; MEMBRANE-BOUND (SHOWN HERE)
AND SOLUBLE/SNRP1; ARE PRODUCED BY ALTERNATIVE SPLICING.

TISSUE SPECIFICITY: THE EXPRESSION OF MEMBRANE-BOUND AND
SOLUBLE/SNRP1 ISOFORMS DOES NOT SEEM TO OVERLAP. THE MEMBRANE
BOUND ISOFORM IS EXPRESSED BY THE BLOOD VESSELS OF DIFFERENT
TISSUES. IN THE DEVELOPING EMBRYO IT IS FOUND PREDOMINANTLY ]
NERVOUS SYSTEM. IN ADULT TISSUES, IT IS HIGHLY EXPRESSED IN 1
                                                                                                                                                                                                                                                     FUNCTION: THE MEMBRANE-BOUND ISÓFORM IS A RECEPTOR INVOLVED IN DEVELOPMENT OF THE CARDJOVASCULAR SYSTEM, IN ANGIOGENESIS, IN TORMATION OF CERTAIN NEURONAL CIRCUITS AND IN ORGANOGENESIS OUTSIDE THE NERVOUS SYSTEM. IT MEDIATES THE CHEMOREPULSANT ACTIVITY OF SEMAPHORINS. IT BINDS TO SEMAPHORIN 3A, THE PLGF-2 ISOFORM OF PGF, THE VEGF-165 ISOFORM OF VEGF AND VEGF-B. COEXPRESSION WITH KDR RESULTS IN INCREASED VEGF-165 BINDING TO AS WELL AS INCREASED CHEMOTAXIS. IT MAY REGULATE VEGF-INDUCED
                                                                                                                                                                         FUNCTION: THE SOLUBLE/SNRP1 ISOFORM BINDS VEGF-165 AND APPEARS TO INHIBIT ITS BINDING TO CELLS. IT MAY ALSO INDUCE APOPTOSIS SEQUESTERING VEGF-165. MAY BIND AS WELL VARIOUS MEMBERS OF THE SEMAPHORIN FAMILY. ITS EXPRESSION HAS AN AVERSE EFFECT ON BLOO
                                                                                                                                         SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN. THE
                                                                                                                                                           VESSEL NUMBER AND INTEGRITY.
                                                                                                                                                                                                                                           ANGIOGENESIS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       90:739-751(1997).

APPLICANT: Gilbertson, Debra G.

APPLICANT: Hart, Charles E.

TITLE OF INVENTION: METHODS FOR PROMOTING GROWTH OF

TITLE OF INVENTION: LIGAMENT AND CARTILAGE USING ZVE

FILE REFERENCE: 00-28

CURRENT APPLICATION NUMBER: US/09/540,224

CURRENT FILLING DATE: 2000-03-31

EARLIER APPLICATION NUMBER: US 60/180,169

EARLIER FILLING DATE: 2000-02-04

NUMBER OF SEQ ID NOS: 9

SOFTWARE: FASTSEQ for Windows Version 3.0

SEQ ID NO 5

LENGTH: 345

TYPE: PRT

ORGANISM: Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleic acids; the recombinant expression of human zvegf4; an antibody which binds to human zvegf4 or a fragment thereof; a method of activating a cell-surface PDGF receptor using a zvegf4-derived polypeptide; a cell-surface PDGF receptor using a zvegf4-derived polypeptide; a cell-surface polypeptides; a method of modulating the proliferation, differentiation, migration or metabolism of bone cells, comprising exposing bone cells to zvegf4-derived polypeptides; and a method of detecting a genetic abnormality in the zvegf4 gene of a patient. zvegf4 proteins and derived fragments may be used to stimulate tissue development or repair, or cellular differentiation or proliferation. They are particularly used for the treatment or repair of liver damage, and may also be used to modulate neurite growth (e.g., in the treatment of Alzheimer's disease or multiple sclerosis). Due to their osteogenic activity, they may be used in the treatment of periodontal disease and fractures. They may also be used to enhance expansion and mobilisation of haematopoietic stem cells treatment of ischaemia, in wound healing, which may be useful in the treatment of ischaemia, in wound healing, and in the modulation of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

Zvegf4 is a member of the PDGF (platelet-derived growth factor)/VEGF (vascular endothelial growth factor) family. Zvegf4 has a growth factor domain (AAB48654) characterised by a PDGF cystine knot structure, and a CUB domain (AAB48655) which has a beta barrel structure. Zvegf4 has PDGF-like activity, having mitogenic activity on fibroblasts, vascular smooth muscle cells and pericytes, and has also been shown to stimulate bone growth. The invention also relates to fusion proteins comprising human zvegf4 or fragments thereof, particularly human zvegf4/human zvegf4 fusions; expression constructs and host cells comprising human zvegf4 nucleic acids; the recombinant expression of human zvegf4; an antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page 130-131; 143pp; English.

C(PDEF) family. The CUB domain shows homology to CUB domains in C neuropilins, human bone morphogenetic protein. L porcine seminal plasma C protein, bovine acidic seminal fluid protein and Xenopus laevis CC tolloid-like protein. Structural analysis and homology predict that CC ZVEGF3 polypeptides complex with a second polypeptide to form multimeric C proteins. The human zvegf3 gene has been mapped to chromosome 4q28.3. CC proteins suseful for stimulating the growth of fibroblasts or smooth CC muscles cells, for activating cell surface PDGF-alpha receptor and for C inhibiting PDGF-alpha receptor mediated cellular processes. ZVEGF3 is useful for regulating (post-development) organ growth, regeneration and CC maintenance, as well as tissue maintenance and repair processes. ZVEGF3 CC diabetic retinopathy, ischemic limb disease, peripheral vascular CC disease, myocardial ischemia, vascular intimal hyperplasia, and continuous c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               07-DEC-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This shows a murine ZVEGF3 a novel vascular endothelial growth factor homologue. Polypeptides comprising an epitope-bearing portion human or murine ZVEGF3 are claimed. The growth factors comprise a growth factor domain and a CUB domain (generic sequence motifs are shown in AAY96859 and AAY96860). The growth factor domain is characterized by an arrangement of cysteine residues and beta-strands that is characteristic of the "cysteine knot" structure of the platelet-derived growth factor (PDGF) family. The CUB domain shows homology to CUB domains in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel zvegf3 polypeptides and nucleotides encoding them useful for stimulating growth of smooth muscle cells and fibroblasts comprising epitope bearing portion of a specific amino acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gao

The present sequence represents murine platelet-derived growth factor (PDGF-C) (formally designated VEGF-F). PDGF-C polypeptides have the ability to stimulate and enhance proliferation or differentiation, and/or growth or motility of cells expressing a PDGF-C receptor.
